

Ultra Wave

Ultrawave are monthly hydrogel contact lenses famous for their high quality and original design, even winning the prestigious Queen Elizabeth Design Award. This prize is given only to the highest-quality products made in the UK. Ultrawave contact lenses are designed to routinely correct both myopia and hyperopia deficiencies. Experts know them as Smart lenses and often refer to them as the Rolls Royce of contact lenses. The word “perfect” is used to describe them by drivers, athletes, computer experts and other wearers and is also how people of presbyopic age and lens-wearers with low astigmatism describe them. Their unique design and biocompatible lens material provides sharper vision during the day and also at dusk (they increase contrast sensitivity). They provide maximum comfort for everyday wear, especially when working on a computer (aiding the elimination of dry eye syndrome). Ultrawave lenses are extremely suitable for suppressing astigmatism up to 1.25 and for people with oncoming presbyopia.

The UV filter in contact lenses increases the protection of the cornea from the dangerous ultraviolet radiation. However, lenses do not cover the entire eye or eye area, so the combination of contact lenses that have UV filter and [sunglasses](#) is the ideal protection against harmful UV rays.

Specifications:

Base radius: 8.60

Diameter: 14.20

Power: -12.00 to +6.00

Water content: 57%
